

CAPILLARY TUBES WITH ADDED VALUES

REAL PROBLEM SOLUTION STARTS BEFORE PRODUCTION; IT DOES NOT END WITH THE DELIVERY.

Measuring, testing, securing, building constructions, stabilizing pressure for liquids and gases while being exposed to heat or cold. This does not only sound complex, it is complex. It is the environment in which our customers can plan the use of capillary and precision tubes and put them into practice with our help - and this in different dimensions, tolerances and materials. An environment, in which experience and innovation has always gone hand in hand. An environment, in which we at ETHEN ROHRE have now been feeling well, as a modern tube manufacturer, for more than 5 years.

Our customers are at home in almost every trade. They appreciate our ambition, to always get a bit better and to define quality as ETHEN quality in a different way. Therefore, we use testing methods from ultrasound to eddy current and carry out systematized corrosion tests at capillary and precision tubes of varied material qualities. We can guarantee our customers their chemical composition by a network of worldwide quality suppliers; suppliers that have subjected themselves to numerous certifications - the same as we have done.

By numerous successfully passed customer audits we are continuously required, to keep our processes and testing methods on a top level. For ETHEN process security is an integral element of our long-standing partnership with our customers, because we can guarantee that also after two decades a capillary and precision tube can again be produced with identical parameters.

We consider our assignment to be holistic. This is the reason why we like to take part in the development of drawings and prototypes in a cooperative way before production. That way quality assurance already starts long before the beginning of production. We would like to understand the tasks of our customers in detail, in order to be able to manufacture perfectly fitting capillary and precision tubes. Collaborative thinking beyond the end of production has led us to an innovation, which today still represents a unique selling point in the trade: surplus production from orders is stocked in our logistics centre and offered as immediately available capillary and precision tubes in the ETHEN stock list for short-term delivery. This service has made our customers more flexible, because we have become more flexible. Flexibility that is also visible in our general purchase conditions without minimum quantities applicable to all kind of materials.

Tubes of highest quality - day by day. This is the requirement of ETHEN ROHRE; a requirement that can only be fulfilled by somebody who loves tubes and feels obliged to precision.
